# Using fuse-3ds on macOS

The standalone Mac application requires OS X 10.9.5 or later.

FUSE for macOS (OSXFUSE) is required. You can download the latest version at **https://osxfuse.github.io**.

Gatekeeper

The application is currently not signed. Gatekeeper may prevent you from opening it. To run the application, control-click the fuse-3ds app, then click Open.

This may not work correctly if the application is run directly from the disk image. Copy the application out to allow it to start.

Note about macOS Mojave

If you are using Mojave, you may see an alert about Terminal trying to control System Events. You need to allow it or the GUI will not start.

If it was denied, you can allow it manually in System Preferences → Security & Privacy → Privacy → Automation → Terminal.
